★TOPIC:- HARDWARE

Module_1-Day_2:

❖ Tasks:

1. **Draw a labeled diagram of an ATX motherboard and mark at least 8 different slots and ports (such as RAM slots, PCIe slots, SATA ports, USB headers, CPU socket, power connector, etc.).**

⇨

2. **Research and list 3 popular CPU socket types (for example: LGA1151, AM4, LGA1200) and name one compatible CPU model for each.**

⇨

- A CPU socket is the place on the motherboard where the processor (CPU) is installed. Different sockets support different CPU models.

No.	CPU Socket Type	Compatible CPU Model
1	Intel LGA 1151	Intel Core i7-7700
2	AMD AM4	AMD Ryzen 5 5600X
3	Intel LGA 1200	Intel Core i5-10400

3. **Explain in your own words the primary functions of the CPU and the chipset on a motherboard, and describe how they work together when you open a music app like Spotify.**

⇨

- **CPU (Central Processing Unit):** The CPU is the brain of the computer. It processes instructions, performs calculations, and controls the execution of programs. When you open Spotify, the CPU runs the app and processes its instructions.

- **Chipset:** The chipset manages communication between the CPU and other hardware components, such as USB ports, storage devices, and other connected peripherals. It helps different parts of the computer work together efficiently.

- **How They Work Together When Opening Spotify:**
  - When you open Spotify, the CPU processes the instructions needed to launch the application. The chipset helps coordinate communication between the CPU, RAM, and storage devices so the required data can be accessed. The CPU then processes the music data, and the audio system plays the sound through your speakers or headphones.

4. **Find a clear photo of a real motherboard (from the internet or your own device), and identify at least 5 different ports or slots by circling them and labeling each one.**

⇨
